InstaGreeting – Java Assignment

1. Install the latest JDK and Eclipse IDE on your system, then take a screenshot of Eclipse showing the Welcome screen after a successful launch.

Answer: This task is completed on the user's computer. Install a current JDK and Eclipse IDE, launch Eclipse successfully, and take a screenshot of the Welcome screen. The screenshot should be attached separately as proof of installation and successful launch.

2. Create a new Java project in Eclipse named InstaGreeting, add a class called InstaWelcome, and write code to print 'Welcome to Instagram Java Edition!' using System.out.println().

Answer: Create the project **InstaGreeting**, then create the class **InstaWelcome** and use the following code:

Code:

```
public class InstaWelcome {
    public static void main(String[] args) {
        System.out.println("Welcome to Instagram Java Edition!");
    }
}
```

3. In your InstaWelcome class, add comments above each section to clearly label the class declaration, the main method, and the print statement. Hint: Use // for single-line comments to explain each part.

Answer: Use single-line comments to label each required section:

Code:

```
// Class declaration
public class InstaWelcome {

    // Main method
    public static void main(String[] args) {

        // Print statement
        System.out.println("Welcome to Instagram Java Edition!");
    }
}
```

4. Modify your InstaWelcome program to print your favorite app's name and your name on separate lines using two System.out.println() statements.

Answer: Example solution: replace the sample app/name with your own details if required.

Code:

```
public class InstaWelcome {
    public static void main(String[] args) {
        System.out.println("My Favorite App: Instagram");
        System.out.println("My Name: Swaraj Kumar");
    }
}
```

5. Write a short note (2-3 lines) in a comment at the top of your InstaWelcome.java file explaining the difference between JDK, JRE, and JVM in your own words. Hint: Imagine explaining it to a friend who's never coded

before.

Answer: A simple 3-line comment can be written at the top of the file:

Code:

```
// JDK is the toolkit used by developers to create and run Java programs.
// JRE provides the environment and libraries needed to run Java programs.
// JVM is the part that actually executes Java bytecode on the computer.
```

Note: Task 1 requires an actual screenshot from the user's Eclipse installation, so the PDF provides the required instruction rather than fabricating a screenshot.
